

Exercise 26 (The Laplace Transform). Find the Laplace Transform of the following functions:

- | | | |
|------------------------------|---------------------------------|---|
| (a) $f(t) = e^{-2t}$ | (e) $f(t) = \frac{\sinh t}{t}$ | (i) $f(t) = \begin{cases} 2 & 0 < t \leq 3 \\ 0 & t > 3 \end{cases}$ |
| (b) $f(t) = 3t^2$ | (f) $f(t) = t^2 \cos 2t$ | (j) $f(t) = \begin{cases} \sin 2t & \pi \leq t \leq 2\pi \\ 0 & t < \pi \text{ or } t > 2\pi \end{cases}$ |
| (c) $f(t) = \cos^2 2t$ | (g) $f(t) = \frac{e^{3t}-1}{t}$ | |
| (d) $f(t) = t \cos t + te^t$ | (h) $f(t) = te^{-t} \sin^2 t$ | |

Solution 26.

(a) Note that

$$\mathcal{L}[e^{-2t}](s) = \int_0^\infty e^{-st} e^{-2t} dt = \int_0^\infty e^{-t(s+2)} dt = \frac{1}{s+2}$$

(b) Note that

$$\mathcal{L}[t^2] = (-1)^2 \frac{d^2}{ds^2} (\mathcal{L}[1]) = (-1)^2 \frac{d^2}{ds^2} \left(\frac{1}{s} \right) = (-1)^2 \frac{d}{ds} \left(-\frac{1}{s^2} \right) = \frac{2}{s^3}.$$

Consequently, we get

$$\mathcal{L}[3t^2] = 3\mathcal{L}[t^2] = \frac{6}{s^3}.$$

(c) Note that $\cos^2 2t = \frac{1}{2}(1 + \cos 4t)$ which implies that

$$\mathcal{L}[\cos^2 2t] = \frac{1}{2} \mathcal{L}[1 + \cos 4t] = \frac{1}{2} \left(\frac{1}{s} + \frac{s}{s^2 + 16} \right).$$

(d) Since multiplication by t is equivalent to taking derivative with respect to s and multiplying by -1 , it follows that

$$\begin{aligned} \mathcal{L}[t \cos t + te^t] &= (-1) \frac{d}{ds} \mathcal{L}[\cos t + e^t] = (-1) \frac{d}{ds} \left(\frac{s}{s^2 + 1} + \frac{1}{s-1} \right) \\ &= (-1) \left(\frac{1-s^2}{s^2+1} - \frac{1}{(s-1)^2} \right) = \frac{s^2-1}{s^2+1} + \frac{1}{(s-1)^2}. \end{aligned}$$

(e) Note first that since

$$(-1) \frac{d}{ds} \mathcal{L} \left[\frac{\sinh t}{t} \right] = \mathcal{L} \left[t \frac{\sinh t}{t} \right] = \mathcal{L}[\sinh t] = \frac{1}{s^2 - 1}$$

we have that

$$\mathcal{L} \left[\frac{\sinh t}{t} \right] = - \int \frac{ds}{s^2 - 1} = -\frac{1}{2} \int \left(\frac{1}{s-1} - \frac{1}{s+1} \right) ds = \frac{1}{2} \ln \left(\frac{s+1}{s-1} \right).$$

(f) We calculate that

$$\begin{aligned} \mathcal{L}[t^2 \cos 2t] &= (-1)^2 \frac{d^2}{ds^2} \mathcal{L}[\cos 2t] = (-1)^2 \frac{d^2}{ds^2} \left(\frac{s}{s^2 + 4} \right) = \frac{d}{ds} \left(\frac{s^2 + 4 - 2s^2}{(s^2 + 4)^2} \right) = \frac{d}{ds} \left(\frac{4 - s^2}{(s^2 + 4)^2} \right) \\ &= \frac{-2s(s^2 + 4)^2 - (4 - s^2)4s(s^2 + 4)}{(s^2 + 4)^4} = \frac{-2s(s^2 + 4) - (4 - s^2)4s}{(s^2 + 4)^3} \\ &= \frac{2s^3 - 24s}{(s^2 + 4)^3}. \end{aligned}$$

(g) Note first that

$$(-1) \frac{d}{ds} \mathcal{L} \left[\frac{e^{3t} - 1}{t} \right] = \mathcal{L} \left(t \frac{e^{3t} - 1}{t} \right) = \mathcal{L}[e^{3t} - 1] = \frac{1}{s-3} - \frac{1}{s}.$$

It follows that

$$\mathcal{L} \left[\frac{e^{3t} - 1}{t} \right] = - \int \left(\frac{1}{s-3} - \frac{1}{s} \right) ds = \ln \left(\frac{s}{s-3} \right).$$

(h) Recall that $\sin^2 t = \frac{1}{2}(1 - \cos 2t)$. This implies that

$$\begin{aligned}
 \mathcal{L}[te^{-t} \sin^2 t] &= \mathcal{L}\left[te^{-t} \frac{1}{2}(1 - \cos 2t)\right] = \frac{1}{2} \mathcal{L}(te^{-t} - te^{-t} \cos 2t) = \frac{1}{2}(-1) \frac{d}{ds} \left(\frac{1}{s+1} - \frac{(s+1)}{4 + (s+1)^2} \right) \\
 &= \frac{1}{2}(-1) \left(-\frac{1}{(s+1)^2} - \frac{(s+1)^2 + 4 - (s+1)2(s+1)}{((s+1)^2 + 4)^2} \right) = \frac{1}{2} \left(\frac{1}{(s+1)^2} + \frac{4 - (s+1)^2}{((s+1)^2 + 4)^2} \right) \\
 &= \frac{1}{2} \left(\frac{(s+1)^4 + 12(s+1)^2 + 16 - (s+1)^4}{(s+1)^2 ((s+1)^2 + 4)^2} \right) = \left(\frac{6(s+1)^2 + 8}{(s+1)^2 ((s+1)^2 + 4)^2} \right) \\
 &= \frac{(6s^2 + 12s + 14)}{(s+1)^2 (s^2 + 2s + 5)^2}.
 \end{aligned}$$

(i) We calculate that

$$\mathcal{L}[f(t)] = \int_0^\infty e^{-st} f(t) dt = \int_0^3 2e^{-st} dt = \left[\frac{-2e^{-st}}{s} \right]_0^3 = \frac{2 - 2e^{-3s}}{s}.$$

(j) Let $\tau = t - \pi$ and $\varphi = t - 2\pi$. Then, we get

$$\begin{aligned}
 \mathcal{L}(f(t)) &= \int_0^\infty e^{-st} f(t) dt \\
 &= \int_\pi^{2\pi} e^{-st} f(t) dt \\
 &= \int_\pi^\infty e^{-st} \sin 2t dt - \int_{2\pi}^\infty \sin 2te^{-st} dt \\
 &= \int_0^\infty e^{-s(\tau+\pi)} \sin(2\tau + 2\pi) d\tau - \int_0^\infty \sin(2\varphi + 4\pi) e^{-s(\varphi+2\pi)} d\varphi \\
 &= \frac{2e^{-\pi s}}{s^2 + 4} - \frac{2e^{-2\pi s}}{s^2 + 4} \\
 &= \frac{2(e^{-\pi s} - e^{-2\pi s})}{s^2 + 4}.
 \end{aligned}$$

Exercise 27 (The Inverse Laplace Transform). Find the inverse Laplace Transform of the following functions:

$$(a) F(s) = \frac{1}{s-2}$$

$$(f) F(s) = \frac{2s+1}{s(s^2+9)}$$

$$(j) F(s) = \ln\left(1 + \frac{1}{s^2}\right)$$

$$(b) F(s) = \frac{1}{s} - \frac{2}{s^{5/2}}$$

$$(g) F(s) = \frac{s^3}{(s-4)^4}$$

$$(k) F(s) = \arctan\left(\frac{3}{s+2}\right)$$

$$(c) F(s) = \frac{3s+1}{s^2+4}$$

$$(h) F(s) = \frac{s^2-2s}{s^4+5s^2+4}$$

$$(l) F(s) = \frac{s}{(s^2+1)^3}$$

$$(d) F(s) = \frac{2e^{-3s}}{s}$$

$$(i) F(s) = \frac{2s^3-s^2}{(4s^2-4s+5)^2}$$

$$(m) F(s) = \frac{e^{-s}}{s+2}$$

Solution 27.

$$(a) f(t) = e^{2t}$$

$$(b) f(t) = 1 - \frac{8}{3\sqrt{\pi}} t^{\frac{3}{2}}$$

$$(c) f(t) = 3 \cos 2t + \frac{1}{2} \sin 2t$$

$$(d) f(t) = 2u_3(t)$$

$$(e) f(t) = \frac{1}{3} (e^{3t} - 1)$$

$$(f) f(t) = \frac{1}{9} (6 \sin 3t - \cos 3t + 1)$$

$$(g) f(t) = e^{4t} \left(1 + 12t + 24t^2 + \frac{32}{3}t^3\right)$$

$$(h) f(t) = \frac{1}{3} (2 \cos 2t + 2 \sin 2t - 2 \cos t - \sin t)$$

$$(i) f(t) = \frac{1}{64} e^{\frac{t}{2}} [(4t+8) \cos t + (4-3t) \sin t]$$

(j) Note that since $\mathcal{L}[tf(t)] = (-1)\frac{dF}{ds}$, we have that $\mathcal{L}^{-1}\left[\frac{dF}{ds}\right] = (-1)tf(t)$. Therefore

$$\frac{dF}{ds} = \frac{\frac{-2}{s^3}}{\left(1 + \frac{1}{s^2}\right)} = -\frac{2}{s(s^2+1)}$$

$$\mathcal{L}^{-1}\left[\frac{dF}{ds}\right] = -\mathcal{L}^{-1}\left[\frac{2}{s(s^2+1)}\right] = (-1)tf(t)$$

$$\mathcal{L}^{-1}\left[\frac{2}{s(s^2+1)}\right] = \mathcal{L}^{-1}\left[\frac{2}{s} - \frac{2s}{s^2+1}\right] = tf(t)$$

$$2 - 2 \cos t = tf(t)$$

$$f(t) = \frac{2(1 - \cos t)}{t}$$

(k) Here, we again use the formula $\mathcal{L}^{-1}\left[\frac{dF}{ds}\right] = (-1)tf(t)$ to calculate that

$$\frac{dF}{ds} = \frac{\frac{-3}{(s+2)^2}}{1 + \left(\frac{3}{s+2}\right)^2}$$

$$= -\frac{3}{s^2 + 4s + 13} = -\frac{3}{(s+2)^2 + 9}$$

$$\mathcal{L}^{-1}\left[\frac{dF}{ds}\right] = -\mathcal{L}^{-1}\left[\frac{3}{(s+2)^2 + 9}\right] = (-1)tf(t)$$

$$e^{-2t} \sin 3t = tf(t)$$

$$f(t) = \frac{e^{-2t} \sin 3t}{t}.$$

$$(l) f(t) = \frac{1}{8} (t \sin t - t^2 \cos t)$$

(m)

$$f(t) = \mathcal{L}^{-1}\left(\frac{e^{-s}}{s+2}\right) = \begin{cases} e^{-2(t-1)} & t \geq 1 \\ 0 & t < 1 \end{cases}$$

$$= u_1(t)e^{-2(t-1)}$$

where u is the unit step function.
