Professor's Name / Öğretim Üyesi

Your Department / Bölüm

- This exam is closed book.
- Give your answers in exact form (for example  $\frac{\pi}{3}$  or  $5\sqrt{3}$ ), except as noted in particular problems.
- Calculators, cell phones are not allowed.
- In order to receive credit, you must **show all of your work**. If you do not indicate the way in which you solved a problem, you may get little or no credit for it, even if your answer is correct. **Show your work in evaluating any limits, derivatives.**
- Place  a box around your answer to each question.
- If you need more room, use the backs of the pages and indicate that you have done so.
- Do not ask the invigilator anything.
- Use a **ball-point pen** to fill the cover sheet. Please make sure that your exam is complete.
- Time limit is 90 min.

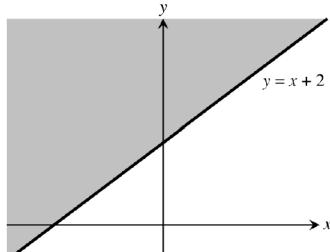

Problem	Points	Score
1	25	
2	25	
3	25	
4	25	
Total:	100	

Do not write in the table to the right.

1. (a) [8 points] Find and sketch the domain for  $f(x,y) = \sqrt{y-x-2}$ .

**Solution:**

Domain: all points  $(x, y)$  on or above the line  
 $y = x + 2$

p.753, pr.5

(b) [8 points]  $\lim_{\substack{(x,y) \rightarrow (1,1) \\ x \neq 1}} \frac{xy - y - 2x + 2}{x - 1} = ?$

**Solution:**

$$\begin{aligned} \lim_{\substack{(x,y) \rightarrow (1,1) \\ x \neq 1}} \frac{xy - y - 2x + 2}{x - 1} &= \lim_{\substack{(x,y) \rightarrow (1,1) \\ x \neq 1}} \frac{(x-1)(y-2)}{x-1} \\ &= \lim_{(x,y) \rightarrow (1,1)} (y-2) \\ &= (1-2) = -1 \end{aligned}$$

p.762, pr.15

(c) [9 points]  $\lim_{(x,y) \rightarrow (0,0)} g(x,y) = \frac{x-y}{x+y} = ?$

**Solution:** Along  $y = kx$ , we have

$$\begin{aligned} \lim_{(x,y) \rightarrow (0,0)} \frac{x-y}{x+y} &= \lim_{(x,kx) \rightarrow (0,0)} \frac{x-(kx)}{x+(kx)} \\ &= \lim_{x \rightarrow 0} \frac{1-k}{1+k} \\ &= \frac{1-k}{1+k} \end{aligned}$$

Different limits for different values of  $k$  so the original limit DOES NOT EXIST.

p.762, pr.45

2. (a) [10 points] Suppose  $w = \frac{x}{z} + \frac{y}{z}$ ,  $x = \cos^2 t$ ,  $y = \sin^2 t$ , and  $z = \frac{1}{t}$ . Find  $\left[ \frac{dw}{dt} \right]_{t=3}$ .

**Solution:**

$$\frac{\partial w}{\partial x} = \frac{1}{z}, \frac{\partial w}{\partial y} = \frac{1}{z}, \frac{\partial w}{\partial z} = \frac{-(x+y)}{z^2}, \frac{dx}{dt} = -2 \cos t \sin t, \frac{dy}{dt} = 2 \sin t \cos t, \frac{dz}{dt} = -\frac{1}{t^2},$$

$$\Rightarrow \frac{dw}{dt} = -\frac{2}{z} \cos t \sin t + \frac{2}{z} \sin t \cos t + \frac{x+y}{z^2 t^2} = \frac{\cos^2 t + \sin^2 t}{\left(\frac{1}{t^2}\right)(t^2)};$$

$$w = \frac{x}{z} + \frac{y}{z} = \frac{\cos^2 t}{\left(\frac{1}{t}\right)} + \frac{\sin^2 t}{\left(\frac{1}{t}\right)} = t \Rightarrow \frac{dw}{dt} = 1$$

$$\Rightarrow \frac{dw}{dt} (3) = 1$$

p.790, pr.15

- (b) [15 points] If  $w = \ln(x^2 + y^2 + z^2)$ ,  $x = ue^v \sin u$ ,  $y = ue^v \cos u$ ,  $z = ue^v$ , find  $\frac{\partial w}{\partial u}$  and  $\frac{\partial w}{\partial v}$  at  $(u, v) = (-2, 0)$ .

**Solution:** Note that

$$\frac{\partial w}{\partial u} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial u} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial u},$$

and

$$x^2 + y^2 + z^2 = u^2 e^{2v} \sin^2 u + u^2 e^{2v} \cos^2 u + u^2 e^{2v} = 2u^2 e^{2v}.$$

Then, we get

$$\begin{aligned} \frac{\partial w}{\partial x} \frac{\partial x}{\partial u} &= \frac{2x}{x^2 + y^2 + z^2} (e^v \sin u + ue^v \cos u) = \frac{2ue^v \sin u}{2u^2 e^{2v}} (e^v \sin u + ue^v \cos u) \\ &= \frac{e^v \sin^2 u + ue^v \sin u \cos u}{ue^v}, \end{aligned}$$

$$\frac{\partial w}{\partial y} \frac{\partial y}{\partial u} = \frac{2y}{x^2 + y^2 + z^2} (e^v \cos u - ue^v \sin u) = \frac{e^v \cos^2 u - ue^v \cos u \sin u}{ue^v},$$

$$\frac{\partial w}{\partial z} \frac{\partial z}{\partial u} = \frac{2z}{x^2 + y^2 + z^2} (e^v) = \frac{2ue^v}{2u^2 e^{2v}} (e^v) = \frac{1}{u}.$$

This implies that

$$\frac{\partial w}{\partial u} = \frac{e^v}{ue^v} + \frac{1}{u} = \frac{2}{u} \Rightarrow \frac{\partial w}{\partial u}|_{u=-2} = -1.$$

Similarly, we have

$$\frac{\partial w}{\partial v} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial v} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial v}.$$

Each term can be calculated as follows.

$$\frac{\partial w}{\partial x} \frac{\partial x}{\partial v} = \frac{2x}{x^2 + y^2 + z^2} (ue^v \sin u) = \frac{2ue^v \sin u}{2u^2 e^{2v}} (ue^v \sin u) = \sin^2 u.$$

$$\frac{\partial w}{\partial y} \frac{\partial y}{\partial v} = \frac{2y}{x^2 + y^2 + z^2} (ue^v \cos u) = \frac{\cos u}{ue^v} (ue^v \cos u) = \cos^2 u.$$

$$\frac{\partial w}{\partial z} \frac{\partial z}{\partial v} = \frac{2z}{x^2 + y^2 + z^2} (ue^v) = \frac{2ue^v}{2u^2 e^{2v}} (ue^v) = 1.$$

This implies that

$$\frac{\partial w}{\partial v} = 2 \Rightarrow \frac{\partial w}{\partial v}|_{v=0} = 2.$$

p.753, pr.5

3. (a) [8 points] Find the derivative of  $f(x, y, z) = xy + yz + xz$  at  $P_0(1, -1, 2)$  in the direction of  $\mathbf{A} = 3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}$ .

**Solution:**

$$\mathbf{u} = \frac{\mathbf{A}}{|\mathbf{A}|} = \frac{3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}}{\sqrt{(3)^2 + 6^2 + (-2)^2}} = \frac{3}{7}\mathbf{i} + \frac{6}{7}\mathbf{j} - \frac{2}{7}\mathbf{k}; f_x(x, y, z) = y + z \Rightarrow f_x(1, -1, 2) = 1; f_y(x, y, z) = x + z \Rightarrow$$

$$f_y(1, -1, 2) = 3; f_z(x, y, z) = y + x \Rightarrow f_z(1, -1, 2) = 0 \Rightarrow \nabla f = \mathbf{i} + 3\mathbf{j} \Rightarrow (D_{\mathbf{u}}f)_{P_0} = \nabla f \cdot \mathbf{u} = \frac{3}{7} + \frac{18}{7} = 3.$$

p.790, pr.15

- (b) **9 points** Find the directions in which  $f(x, y) = x^2 + xy + y^2$  increases and decreases most rapidly at  $P_0(-1, 1)$ . Then find the derivatives in these directions.

**Solution:**  $\nabla f = (2x+y)\mathbf{i} + (x+2y)\mathbf{j} \Rightarrow \nabla f(-1, 1) = -\mathbf{i} + \mathbf{j} \Rightarrow \mathbf{u} = \frac{\nabla f}{|\nabla f|} = \frac{-\mathbf{i} + \mathbf{j}}{\sqrt{(-1)^2 + 1^2}} = -\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$ ;  $f$  increases most rapidly in the direction  $\mathbf{u} = -\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$  and decreases most rapidly in the direction  $-\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}$ ;  $(D_{\mathbf{u}}f)_{P_0} = \nabla f \cdot \mathbf{u} = |\nabla f| = \sqrt{2}$  and  $(D_{-\mathbf{u}}f)_{P_0} = -\sqrt{2}$

p.791, pr.19

- (c) **8 points** In what direction is the derivative of  $f(x, y) = xy + y^2$  at  $P(3, 2)$  equal to zero? Give your reasons.

**Solution:**  $\nabla f = y\mathbf{i} + (x+2y)\mathbf{j} \Rightarrow \nabla f(3, 2) = 2\mathbf{i} + 7\mathbf{j}$ ; a vector orthogonal to  $\nabla f$  is  $\mathbf{v} = 7\mathbf{i} - 2\mathbf{j} \Rightarrow \mathbf{u} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{7\mathbf{i} - 2\mathbf{j}}{\sqrt{(7)^2 + (-2)^2}} = \frac{7}{\sqrt{53}}\mathbf{i} - \frac{2}{\sqrt{53}}\mathbf{j}$  and  $-\mathbf{u} = -\frac{7}{\sqrt{53}}\mathbf{i} + \frac{2}{\sqrt{53}}\mathbf{j}$  are the directions where the derivative is zero.

p.791, pr.31

4. (a) **12 points** Suppose  $x^2 + 2xy - y^2 + z^2 = 7$ . Find equations for the (a) tangent plane and (b) normal line at the point  $P_0(1, -1, 3)$  on the surface.

**Solution:** Let

$$F(x, y, z) := x^2 + 2xy - y^2 + z^2 - 7$$

so that

$$\nabla F(x, y, z) = (2x+2y)\mathbf{i} + (2x-2y)\mathbf{j} + 2z\mathbf{k}$$

and  $\nabla F(1, -1, 3) = (2(1) + 2(-1) + 2(3))\mathbf{i} + (2(-3) - 2(2) + 3)\mathbf{j} + (-1)\mathbf{k} = 4\mathbf{j} + 6\mathbf{k}$ . Hence

1. the equation of the tangent plane at  $P_0(1, -1, 3)$  is

$$0(x-1) + 4(y+1) + 6(z-3) = 0$$

or  $2y + 3z = 7$ .

2. Similarly, the equations of the normal line through  $P_0(1, -1, 3)$  are

$$x = 1, y = -1 + 4t, z = 3 + 6t.$$

p.799, pr.4

- (b) 13 points Find all the local maxima, local minima, and the saddle points of  $f(x,y) = x^2 - y^2 - 2x + 4y + 6$ .

**Solution:** We first compute the partial derivatives:  $f_x(x,y) = 2x - 2 = 0$  and  $f_y(x,y) = -2y + 4 = 0$ . Since both partial derivatives are defined for all  $(x,y)$ , the critical points are solutions for the two equations

$$f_x = 2x - 2 = 0$$

and

$$f_y = -2y + 4 = 0.$$

Hence  $x = 1$   $y = 2$ , critical point is  $(1,2)$ ;

for  $(1,2)$ :  $f_{xx}(1,2) = 2$ ,  $f_{yy}(1,2) = -2$ ,  
 $f_{xy}(1,2) = 0 \Rightarrow f_{xx}f_{yy} - f_{xy}^2 = -4 < 0 \Rightarrow$  SADDLE POINT

p.808, pr.9
